

"Making Sense out of Rubbish"

Rotary Compactor

A Rotary Waste Compactor takes up little more space than a standard wooden pallet, yet amazingly can compact the entire contents of a waste skip into one polythene wastebag.

A compacting ratio of 6:1!

Because it is so compact, the system can be sited conveniently at the very source of waste, such as the factory floor - no more time and effort spent hauling refuse from factory to outside skips.

Many different kinds of refuse can be processed including wet and dry waste, tins, glass and broken pallets.

The waste-crushing rotating rotor arm has a minimum downward pressure of 80 kgs and the torque at the compactor drum face is 2000 kgs.

Some waste management systems can leave a mess in their wake. With a Rotary Compactor the finished "product" is a clean, heavy polythene bag which can be hygienically sealed with any packaging tape.

Even if the compactor is processing wet or damp waste such as foodstuffs, there are no spills and no sticky trails to attract dust, grime and bacteria.
